

Should cloud seeding be allowed?

In my opinion, cloud seeding should not be allowed. Though it may be a solution to drought today, the risks it poses overtime with the materials used could damage the environment even more. Cloud seeding uses materials that could increase the levels of carbon dioxide (silver iodide) in the atmosphere and could cause ozone layer depletion. In the video Age of Stupid, the climate tipping point is closer than once thought that humans have caused so far. Adding cloud seeding, not only it could cause to damage the environment but may pose as a problem in the future and we might realise it too late.
