

## **Metro Vancouver's last remaining glacier is disappearing fast.**

Last remaining glacier located in Coquitlam, a source of freshwater, will disappear in less than 30 years. Glaciers act like a protective cover over Earth and oceans. It reflects heat back into space and keeps the earth cooler. And with the glaciers melting this causes sea level rising, impacts the climate, less fresh water, and etc. In my opinion, this is definitely a wake up call for us to start caring about our planet. Although we might think that it doesn't affect us now, if we don't start doing something then the consequence will hurt us soon enough and the generations after us. We need to stop being ignorant about our planet hurting and start doing actions about what we need to do to be able to save our planet and the generations next to us. We owe the generations next to us a safe place to live.
